The invention relates to human and mouse genes encoding 3'-5' exonucleases. The exonuclease proteins of the invention can be used to identify inhibitors and effectors of exonuclease activity. Specific binding polypeptides, e.g. antibodies, can be used for purifying connuclease products and detection and quantification of exonuclease products and detection and quantification of exonuclease products and detection and quantification of exonuclease. Connucleases. Polynucleotides of the invention are useful in exonucleases. They are also useful in modulating the activity of exonucleases. They are also useful as the basis for diagnostic methods useful for identifying a genetic alteration in an exonuclease locus that underlies a disease state. Nucleic acids that modulate the expression of the exonuclease genes, e.g. antisense nucleic acids, tribozymes to the exonuclease genes, e.g. antisense nucleic acids, tribozymes, triple or ineffectiveness of certain antineoplastic and antiviral agents may be used to an exonuclease activity. A need exists for the identification of metabolic factors which modulate the ability of chemotherapeutic agents to effect cell killing. This need is met by the present invention. The exonuclease polypeptides of the invention can be used to design and identify therapeutics which increase efficiency of the chemotherapeutic agent at lower doses, which are more easily tolerated in patients, and reducing side effects. The present sequence represents a human TREXhl
                                                                                                                                                                                                                                                                                         gene therapy; protocols. antineoplastic; antiviral; cell killing; human; TREXh1; Exo 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      in hybridization assays to detect the capacity exonucleases -

```
The present sequence represents a human enzyme. The enzyme polynucleotide and polypeptide are useful for diagnosis, treatment and prevention of cancers, neurological disorders (e.g. epilepsy, stroke, Alzheimer's disease, Pick's disease, Huntington's disease, dementia, multiple sclerosis, Parkinson's disease, amyotropic lateral sclerosis, bacterial and viral meningitis, schizophrenic disorders and neuroskeletal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel human enzyme molecule useful for treating and preventing, cancer, genetic disorders, neurological disorders, autoimmune an inflammatory disorders -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ů,

This invention describes novel polynucleotides and polypeptides isolated from human cDNA libraries which can be used for gene therapy or in vaccines. The polynucleotides of the invention and antibodies encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate polypeptide expression. The products of the invention may also be used to identify modulators of expression and activity and to down regulate expression and activity. The antibodies of the invention may also be used as diagnostic agents for detecting the presence of polypeptides in samples. This sequence represents a homologue of a polypeptide described in the disclosure of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nucleic acids having the sequences of clones isolated from libraries of different human tissues, useful in recombinant DNA methodologies -
disorders), autoimmune/inflammatory disorders (e.g. allergies, addison's disease, autoimmune disease, adult respiratory distress syndrome, anemia, asthma, Crohn's disease, atopic dermatitis, diabetes mellitus, osteoporosis, pancreatitis, psoriasis, rheumatoid arthritis, and viral, bacterial, fungal, parasitic, protozoal and helminthic infections), genetic disorder (e.g. Duchenne and Becker muscular dystrophy, Gaucher's disease, Huntington's chorea, sickle cell anemia, thalassemia, Von Willebrand's disease and Wilms' tumour), and cell proliferative disorder (e.g. atherosclerosis, leukemia, hepatitis, cirrhosis, and arteriosclerosis). The polynucleotide is also useful in somatic or germline gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human nucleic acid management-associated DKFZphtes3_15j3 homologue #1
                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                         ·

The invention relates to isolated polynuclectide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The and gene mapping, and in recombinant production of (II). The polymuclectides are also used in diagnostics as expressed sequence tags to restore normal activity of (II) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical disorders involving aberrant protein expression or biological activity. The polypeptide and polynuclectide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and amino acid sequences. Abg00010-Abg30377 represent novel human diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the itp.wipo.int/pub/published_pot_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                  forensic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutation responsible for genetic disorders or other traits and to assess

New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity -

No 47964; 103pp; English. Claim 20; SEQ ID

The invention relates to isolated polynuclectide (1) and polypeptide (11) sequences. (1) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (11). The and gene mapping, and in recombinant production of (11). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (1) is useful in gene therapy techniques to restore normal activity of (11) or to treat disease states involving (11). (11) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (11) and its binding partners are useful in medical imaging of sites expressing (11). (1) and (11) are useful in medical cissorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp. wipo.int/pub/published_pot_sequences.

Identifying, isolating and producing hyperimmune serum-reactive antigens from a pathogen, for preparing vaccine or medicament for treating or preventing e.g. staphylococcal infections, comprises providing antibody preparation -

Claim 24; Page 155; 252pp; English.

The invention relates to a novel method for identifying, isolating and producing hyperimmune serum-reactive antigens from a pathogen, tumour, allergen, a tissue or host prone to auto-immunity, where the antigens are used in a vaccine, comprises providing antibody preparation from a plasma pool of a type of animal, or individual sera with antibodies against the specific pathogen, tumour, allergen, tissue or host prone to auto-immunity. The hyperimmune serum-reactive antigens comprising any of the 62 sequences of 53-2261 amino acids fully defined in the specification, or their hyperimmune fragments are useful for the manufacture of a pharmaceutical preparation, particularly a vaccine against staphylococcal infections or colonisation against S. aureus or S. epidermidis. The manufacture of a medicament for treating or preventing staphylococcal infections or colonisation against S. aureus or S. epidermidis. The antibody preparation of preventing staphylococcal infections or conditions may also be used for diagnostic and imaging purposes. Other conditions that can be treated include cancer, autoimmune diseases or infections caused by viral (e.g. HIV, hepatitis A, B or C), fungal or protozoan pathogens. This sequence represents a staphylococcal protein relating to the method for identifying and producing pathogen specific antigens of the invention.

The polynucleotides of the invention and antibodies encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate polypeptide expression. The products of the invention may also be used to identify modulators of expression and activity and to down regulate expression and activity. The antibodies of the invention may also be used as diagnostic agents for detecting the presence of polypeptides in samples. This sequence represents a polypeptide disclosure of the invention.
                                                                                                  id management-associated protein from DKFZphtes3_15j3

```
This invention describes a novel human testicular exonuclease factor gene (NEF). The NEF gene described in the disclosure if the invention can be used to prepare a fusion protein which can be used to immunise animals to prepare monoclonal and polyclonal antibodies. The protein of the invention can be used to prepare medicines. This sequence represents the human NEF protein described in the invention.
                                                                                                                                                                                                                                                                                                                         Gaps

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes, their use in the discovery of novel antibiotics, the essential constant standard coli, Staphylococcus aureus, Salmonella typhi, Klebsiella Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella constantion is also useful for the identification of potential new targets invention is also useful for the identification of potential new targets of antibiotic development. The antisense nucleic acids can also be used to creen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen to roprammes. The antisense nucleic acid sequence is also useful to screen a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the wipo.int/pub/published_pct_sequences.

New polynucleotides for the identification and development of antibiotics, comprise sequences of antisense nucleic acids -

Example 3; Seq ID No 5836; 511pp; English

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential consists their use in the discovery of novel antibiotics, the essential consists themselves and the encoded proteins. The prokaryotes used are scherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The proumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The construction is also useful for the identification of potential new targets invention is also useful for the antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins.

The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acids sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in essential prokaryotic cellular proliferation protein.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the wipo.int/pub/published_pct_sequences.

There are no restrictions on its use by non-profit institutions as long as its content is in no way modified and this statement is not removed. Usage by and for commercial entities requires a license agreement (See http://www.isb-sib.ch/announce/or send an email to license@isb-sib.ch). "Genome sequence of the endocellular obligate symbiont of tsetse flies, Wigglesworthia glossinidia.";
Nat. Genet. 32:402-407(2002).
-!- FUNCTION: Exhibits a very high intrinsic GTPase hydrolysis rate. Involved in the biosynthesis of the hypermodified nucleoside 5-methylaminomethyl-2-thiouridine, which is found in the wobble position of some tRNAs (By similarity).
-!- SIMILARITY: Belongs to the era/trmE family of GTP-binding proteins. TrmE subfamily. 40S ribosomal protein S15 (RIG protein).
RPS15 OR RIG.
Xiphophorus maculatus (Southern platyfish).

THROUGH THE CF(0) COMPLEX.

CATALYTIC ACTIVITY: ATP + H(2)O + H(+)(In) = ADP + phosphate + H(+)(Out).

SUBUNIT: F-TYPE ATPASES HAVE 2 COMPONENTS, CF(1) - THE CATALYTIC CORE - AND CF(0) - THE MEMBRANE PROTON CHANNEL. CF(1) HAS FIVE SUBUNITS: ALPHA(3), BETA(3), GAMMA(1), DELTA(1), EPSILON(1). CF(0) HAS THREE MAIN SUBUNITS: A, B AND C.

SIMILARITY: Belongs to the ATPase gamma chain family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     "Complete sequence analysis of the genome of the bacterium Mycoplasma pneumoniae.";
Nucleic Acids Res. 24:4420-4449(1996).

Submitted (AUG-1999) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: ONE GAP JUNCTION CONSISTS OF A CLUSTER OF CLOSELY PACKE.
-!- FUNCTION: ONE GAP JUNCTION CONSISTS OF A CLUSTER OF CLOSELY PACKE.
MATERIALS OF LOW MW DIFFUSE PROM ONE CELL TO A NEIGHBORING CELL.
-!- SUBUNIT: A CONNEXON IS COMPOSED OF A HEXAMER OF CONNEXINS.
-!- SUBCELLULAR LOCATION: Integral membrane protein.
-!- SIMILARITY: BELONGS TO THE CONNEXIN FAMILY. ALPHA-TYPE (GROUP II)
-!- CATALYTIC ACTIVITY: ATP + (R)-mevalonate = ADP + (R)-5-
phosphomevalonate.
-!- ENZYME REGULATION: FARNESYL- AND GERANYL-PYROPHOSPHATES ARE
COMPETITIVE INHIBITORS.
-!- PATHWAY: CHOLESTEROL BIOSYNTHESIS, MEVALONATE CATABOLISM.
-!- SUBUNIT: Homodimer.
-!- SUBCELLULAR LOCATION: Cytoplasmic and peroxisomal.
-!- DISEASE: MUTATION IN THE MEVALONATE KINASE GENE CAUSES MEVALONIC
ACIDURIA.
-!- SIMILARITY: BELONGS TO THE GHMP KINASE FAMILY. MEVALONATE KINASE
SUBFAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                16-OCT-2001 (Rel. 40, Created)

Yuan L., Voelker T.A., Hawkins D.J.;
"Modification of the substrate specificity of an acyl-acyl carrier protein thioesterase by protein engineering.";
Proc. Natl. Acad. Sci. U.S.A. 92:10639-10643(1995).
-!- FUNCTION: PLAYS AN ESSENTIAL ROLE IN CHAIN TERMINATION DURING DE NOVO FATTY ACID SYNTHESIS. HIGH THIOESTERASE ACTIVITY FOR LAUROYL-!- CATALYTIC ACTIVITY: Lauroyl-[acyl-carrier protein] + H(2)0 = [acyl-carrier protein] + laurate.
-!- SUBCELLULAR LOCATION: Chloroplast.
-!- SUBCELLULAR LOCATION: Chloroplast.
-!- BIOTECHNOLOGY: Introduced by genetic manipulation and expressed in canola by Monsanto (Calgene) so as to obtein laurate-rich seeds.
-!- SIMILARITY: BELONGS TO THE ACYL-ACP THIOESTERASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CHLOROPLAST (POTENTIAL).

Determination of an agent capable of inhibiting aggregation of alpha

```
The present sequence is an Snf2 related CREB (cAMP regulatory element) binding protein (CBP) activator protein (SRCAP) polypeptide. It has ATPase activity and is capable of activating transcription. SRCAP polypeptides are useful for activating transcription in a cell, for enhancing CREB (cAMP regulatory element) binding protein (CBP)-mediated activation of transcription in a cell, for treating a patient having a disease involving a function such as insufficient transcription of a
                                                                                             hates to screening of inhibitors of alpha-synuclein he presence of exogenous iron or copper. The inhibitors d alpha-synuclein binding peptides, which are ing neurodegenerative disease that involves Lewy bodies e.g. Parkinson's disease (PD), Alzheimer's ffuse Lewy body disease, mixed AD-PD, multiple system ervorden-Spatz disease. The present sequence is a ds to the NAC (non-amyloid-beta protein component) alpha-synuclein and inhibits its aggregation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention is related to a Lactococcus lactis nucleotide sequence (ABA90521) and related proteins (ABB53300-ABB55621). The nucleic acid sequence is useful in the detection and/or amplification of nucleic acid sequence, particularly to identify Lactococcus lactis or related species. The proteins of the invention are useful for the biosynthesis or biodegradation of a composition of interest. The invention helps research in lactic bacteria, particularly useful in the production of yogurt and cheese.

Note: The sequence data for this patent is based on equivalent patent
gene, e.g. a gene mediated by CBP co-activation, DEAD box RNA dependent helicase, adenoviral DBP protein, beta-actin or a nuclear receptor affected by SRCAP protein. Compounds that modulate SRCAP function, such as antibodies, antisense molecules, polynucleotides or ribozymes, are useful for treating diseases mediated by SRCAP-activated transcription, for example, infection by adenovirus, hepatitis C virus, human immunodeficiency virus type-1, Epstein Barr virus, cytomegalovirus or hepatitis B virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Note: The sequence data for this patent is based on equivalent patent WO200177334 (published 18-OCT-2001) which is available in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

N-PSDB; AAL35413.
```

The invention relates to novel genes (AAL34669-AAL37666) and proteins (ABB03087-ABB04109) associated with the musculoskeletal system useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant) agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, cancers e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infections.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences. 22; Length 62; Query Match 88.2%; Score 30; DB 2 Best Local Similarity 100.0%; Pred. No. 53; Matches 6; Conservative 0; Mismatches Sequence

The invention describes an isolated nucleic acid molecule comprising a sequence encoding musculoskeletal system associated polypoptides useful conductor acid: stimulates re-vascularisation of ischemeic or humans. The nucleic acid: stimulates re-vascularisation of ischemeic or humans. The nucleic acid: stimulates re-vascularisation of ischemeic or humans. The nucleic acid: stimulates re-vascularisation of ischemeic or humans. The nucleic acid: stimulates retroaches, arteratiosclerosis, and other cardiovascular conditions; treats wounds due to injuries, burns, bost-operative tissue repair, and ulcers; stimulates and prevent neuronal damage occurring in certain disorders or neurodegenesis or neuronal damage occurring in certain disorders or neurodegenesis or conditions, such as, Alzheimer's disease, Parkinson's disease, and AlDS-related complex; stimulates chondrocyte growth, thus they can be used to enhance bone and periodontal regeneration and aid in tissue conditions, such as, Alzheimer's disease, parkinson's disease, and AlDS-related complex; stimulates chondrocyte growth, thus they can be used to enhance bone and periodontal regeneration and aid in tissue conditions, such as activate hair-forming cells and promotes melanocyte growth, crimaliating keratinocyte growth, prevente hair-forming cells and promotes melanocyte growth, crimaliates growth and differentiation of hematopoietic cells and bone marrow cells when used in combination with other cytokines; maintains complex; increases the differentiation or proliferation of embryon; enemery increases or decreases the differentiate in early computed surgery; modulates mammalian characteristics surgery; modulates mammalian characteristics surgery; modulates mammalian characteristics surgery; modulates mammalian characteristics of actions to physical state by influence, tolerance for percentage of adipose tissue, pigmentation butching protein, carbohydrae, pigmentation or proliphymms, cariodaic rhythms, depression, tendency for violence, tolerance for productive c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Isolated nucleic acid molecules encoding musculoskeletal system associated polypeptides, useful for detecting disorders, e.g. cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ó

This invention relates to the DNA and protein sequences of novel isolated 47476, 67210, 49875, 46842, 33201, 83378, 84233, 64708, 85041 or 84234 proteins. The method of the invention is useful for treating a disorder characterised by aberrant activity of 47476, 67210, 49875, 46842, 33201, 83378, 84233, 64708, 85041 or 84234-expressing cell in a subject. The protein molecules can act as novel diagnostic targets and therapeutic agents for controlling aberrant or deficient signal transduction resulting, in e.g., haematopoeitic disorders related to an inability to clear infections (e.g., viral or bacterial infections), as well as disorders related to abnormal cellular proliferation or disorders of metabolic imbalance (e.g., disorders of lipopolysaccharide disorders or metabolic imbalance (e.g., disorders, or cellular proliferation and/or differentiation disorders, or cellular proliferation and/or differentiation disorders, red blood cell disorders of metabolic disorders differentiative disorders, red blood cell disorders of the small intestine, disorders of metalion or metabolic disorders invertion are also useful for imbalance, protein trafficking disorders and disorders associated with come metabolism. The sequences of the invention are also useful for screening assays, predictive medicine (e.g., diagnostic assays, prognostic assays, monitoring clinical trials, and pharmacogeneics);
                                                                                                                                                                            49875; DEAD type helicase domain; infection; haematopoeitic disorder; blood clotting disorder; cancer; autoimmune disorder; leukaemia; immunological disorder; cardiovascular disorder; neurological disorder; cellular proliferation; red blood cell disorder; viral disease; neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Isolated 47476, 67210, 49875, 46842, 33201, 83378, 84233, 64708, 6 or 84234 polypeptides, useful as reagents or targets for treating diagnosing pain or metabolic, liver, kidney, or cardiovascular disorders
                                                                                                                                         type helicase domain consensus sequence (SMART)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           , monitoring clinical treatment (e.g., theraper represents a predicted

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to proteins from Neisseria gonorrhoeae. Also disclosed are the nucleic acid molecules encoding the proteins and antibodies that specifically bind to the proteins. The composition comprising the protein, nucleic acid or antibody is useful for the manufacture of a medicament for treating or preventing N. gonorrhoeae infection, this may be in the form of a vaccine or gene therapy. Sequences given in records ABP76736-ABP81046 represent nucleic acid molecules of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        οĘ

The invention relates to isolated polynucleotide (I) and probes, polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The and gene mapping, and in recombinant production of (II). The collectides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving or (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations and to produce other types of data and products dependent on DNA and amino acid sequences. AbG00010-ABG30377 represent novel human and acid sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the type int/pub/published_pot_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

iting 1000 or more genes from Drosophila. The invention is
pmental biology and in elucidating cell signalling and
octions in higher eukaryotes for the development of
herapeutics and pharmaceutical drugs. The invention
to DNA sequences (ABL16176-ABL30511), expressed DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; open reading frame; ORFX; gene therapy; cancer; cirrhosis; hyperproliferative disorder; psoriasis; benign tumour; haemorrhage; degenerative disorder; osteoarthritis; neurodegenerative disorder; cardiovascular disease; diabetes mellitus; systemic lupus erythematosus; hypertension; hypothyroidism; cholesterol ester storage disease; immune deficiency; immune disorder; infectious disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                              nt did not form part of the printed in electronic format directly from WIPO of sequences.
                                                                                                                                                                                                                                                                      detection reagent for detecting 1000 or more for elucidating cell signalling and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     der; rheumatoid arthritis; autoimmune thyroiditis

The present invention describes substantially purified human proteins (referred to as open reading frame, ORFX, where X is 1-11491 (see Table 1 in the specification). ABN15762 to ABN27252 encode the human ORFX to proteins given in ABP00010 to ABP11500. ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated disorder in humans, and in the manufacture of a medicament for treating a syndrome associated with ORFX-associated disorder. ORFX polymucleotide sequences can be used in gene therapy. ORFX sequences can be used in the treatment of cancer, hyperproliferative disorders, cirrhosis of liver, psoriasis, benign tumours, keloid, degenerative disorders related to organ transplantation, cardiovascular diseases, diabetes mellitus, systemic clupus erythematosus, hyperthyroidism, cholesterol ester storage disease, various immune disorders and disorders, infectious disease and autoimmune thyroiditis, myasthenia gravis, graft-versus-host disease and autoimmune inflammatory eye disease. ORFX proteins are also useful for treating burns, incisions, ulcers, for treating osteoporosis, bordection or regeneration and treatment of lung or liver fibrosis, reperfusion injury in various tissues and conditions resulting from the printed systemic cytokine damage.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter; termination sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

"Genome sequence of Shigella flexneri 2a: insights into pathogenicity
through comparison with genomes of Escherichia coli K12 and O157.";

Nucleic Acids Res. 30:4432-4441(2002).
-!- FUNCTION: ESSENTIAL FOR RECYCLING GMP AND INDIRECTLY, CGMP.
-!- CATALYTIC ACTIVITY: ATP + GMP = ADP + GDP.
-!- SUBUNIT: HOMOTETRAMER (UNDER LOW IONIC CONDITIONS) OR HOMODIMER
(UNDER HIGH IONIC CONDITIONS).
-!- SUBCELLULAR LOCATION: CYLOPIasmic.
-!- SIMILARITY: BELONGS TO THE GUANYLATE KINASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        SEQUENCE FROM N.A.

-:- FUNCTION: Essential for recycling GMP and indirectly, cGMP.
-:- CATALYTIC ACTIVITY: ATP + GMP = ADP + GDP.
-:- SUBCELULAR LOCATION: Cytoplasmic (By similarity).
-:- SIMILARITY: BELONGS TO THE GUANYLATE KINASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Bacteria, Proteobacteria, Gammaproteobacteria, Enterobacteriales,

-!- FUNCTION: ESSENTIAL FOR RECYCLING GMP AND INDIRECTLY, CGMP.
-!- CATALYTIC ACTIVITY: ATP + GMP = ADP + GDP.
-!- SUBUNIT: HOMOTETRAMER (UNDER LOW IONIC CONDITIONS) OR HOMODIMER (UNDER HIGH IONIC CONDITIONS) (BY SIMILARITY).
-!- SUBCELLULAR LOCATION: CYtoplasmic (By similarity).
-!- SIMILARITY: BELONGS TO THE GUANYLATE KINASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Enterobacteriales;

Zhou L., Lacroute F., Thornburg R.;
Toloning, expression in Escherichia coli, and characterization of
Arabidopsis thaliana UMP/CMP kinase.";
Plant Physiol. 117:245-254(1998).

-!- FUNCTION: FURNISHES THE CELL WITH PYRIMIDINES. ACCEPTS UMP AND
CMP AS PHOSPHATE ACCEPTORS WITH HIGH ACTIVITY; DOES NOT ACT ON
DCMP AND DUMP.

-!- CATALYTIC ACTIVITY: ATP + UMP = ADP + UDP.

C -!- CATALYTIC ACTIVITY: ATP + CMP = ADP + CDP.

-!- SIMILARITY: Belongs to the adenylate kinase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            PYR6.

RT "Rice TATA binding protein interacts functionally with transcription for factor IIB and the RF2a bZIP transcriptional activator in an enhanced RT factor IIB and the RF2a bZIP transcriptional activator in an enhanced RT plant cell 14:795-803(2002).

CC -!- FUNCTION: GENERAL FACTOR THAT PLAYS A MAJOR ROLE IN THE ACTIVATION CC -!- SUBUNIT: ASSOCIATES WITH TFIID-IIA (By similarity).

CC -!- SUBUNIT: ASSOCIATES WITH TFIID-IIA (DA COMPLEX) TO FORM TFIID-CC -!- SUBCELLULAR LOCATION: Nuclear.

CC -!- SUBCELLULAR LOCATION: Nuclear.

CC -!- SIMILARITY: Belongs to the TFIIB family.

CC -!- SIMILARITY: Belongs to the TFIIB family.

"Isolation and characterization of insecticidal genes from Bacilluthuringiensis subsp. jegathesan.";
Submitted (JAN-1997) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: PROMOTES COLLOIDOSMOTIC LYSIS BY BINDING TO THE MIDG EPITHELIAL CELLS OF INSECTS.
-!- DEVELOPMENTAL STAGE: THE CRYSTAL PROTEIN IS PRODUCED DURING SPORULATION AND IS ACCUMULATED BOTH AS AN INCLUSION AND AS PAFOR THE SPORE COAT.
-!- MISCELLANEOUS: TOXIC SEGMENT OF THE PROTEIN IS LOCATED IN THE N-TERMINUS.
-!- SIMILARITY: BELONGS TO THE DELTA ENDOTOXIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Homo sapiens (Human).
